

## Nation's Best Bait for Controlling Moles.

**RCO bait is the only bait to meet Federal/State EPA efficacy requirements.**

- RCO Mole Patrol is field tested with excellent results that show total control even in varying soil types and moisture conditions. Find out why other dealers are turning to a proven winner.
- RCO Mole Bait is designed to be accepted readily by the mole and control them with the least amount of bait and effort by the customer. Convenience and control is what we're all about.
- RCO Mole Bait is packaged in convenient and safety oriented containers. Easy to apply and quite safe to handle, use, and store. Sizes allow for homeowner through commercial needs.
- RCO Mole Bait is an anti-coagulant that has shown single feeding control. Typical control is achieved within several feedings. Single feeding control is not uncommon though, it reacts much like the second generation/"single feed" rat and mouse baits, but without the toxicity associated with these products. Vitamin K is the effective antidote in the event of accidental consumption.
- RCO Mole Bait is pelleted bait that when deposited into the main runway will out compete normally preferred food of the mole, typically worms and other soft-bodied insects. Palatability and acceptance are critical.
- RCO Big Bore Bait Dispenser is available now. It's designed for pelleted bait applications on large sites and for commercial use. Use with the RCO TUT steel probe to assist in locating the below ground tunnel systems prior to baiting. The TUT will reduce probe wear on Big Bore.

**About Moles:** Compact burrowing insectivore. High metabolism enabled by high hemoglobin content in blood. Can fix high levels of oxygen in carbon dioxide rich environment. Live secluded life except when breeding once a year. Will wean and drive off "offspring" into adjoining territories. System tunnels will overlap and moles do share common freeways, but they will not be combatant and always seek solitary freedom. Food is earthworms and soft bodied insects. Some vegetation is part of natural daily diet. Tunnels act as continuously filling hunting field with subdued worms stored in mole food caches. Activity reflects soil's workability and mounding and ridging. The mole works year round and has a three work period day. Life span is about 2-4 years with one litter per year averaging about 3-6 young. Weaned in about 30-40 days.

### Available Retail Sizes

12/8 oz. cs.	Cs/Wt. 7 lbs.	
8 oz. Size Ea.		UPC# 089342-100005
12/16 oz. cs.	Cs/Wt. 13 lbs.	
16 oz. Size Ea.		UPC# 089342-108063
6/3 lb. cs.	Cs/Wt. 20 lbs.	
3 lb. Size Ea.		UPC# 089342-101002
6/5 lb. cs.	Cs/Wt. 32 lbs.
